a combined approach of the hand and wrist: a new concept of total endoprosthetic hand. Implantation of conventional total wrist prostheses is associated with a higher rate of complications and loss of function compared to implantation of a conventional total endoprosthetic hand. In addition, revision surgery with implantation of

conventional hand prostheses is associated with a significantly higher morbidity compared to primary endoprosthetic hand replacement. The aim of this study was to assess the results of a combined approach to the hand and wrist with implantation of a new total endoprosthetic hand (model GRIP II, EBIO-CORPORATE, Bioimplant SRL, Sesto Fiorentino, Italy). This was an observational,

prospective study. A total of 24 patients were enrolled in this study. The combined approach with a new total endoprosthetic hand was performed in 24 patients (16 female, 8 male; mean age, 70 ca3bfb1094

[Obstetrical and neonatal outcomes in patients with

twins: a retrospective study from a single center]. To compare the obstetrical and neonatal outcomes of singleton and twin pregnancies and to identify factors that influence the perinatal outcome in patients with twins. A retrospective study was carried out by reviewing the delivery records of 763 women who had twins from January 2001 to December 2010 at the Obstetrics

Department of Gynaecology and Obstetrics Clinic, University Clinical Center of Serbia. During the study period, 763 twins were delivered in the department. The maternal and neonatal data were compared for the two groups, one of which consisted of normal singleton pregnancies (1,160) and the other of which consisted of twin pregnancies (203). The

mothers were significantly younger (p
