Q: Tkinter button with BGCOLOR I have a problem with my code, I'm creating a tkinter button and I want to apply the right foreground color. But it's not working. Only the normal colors work. This is the code from tkinter import * from PIL import Image, ImageTk class App(Frame): def __init__(self, master): self.master = master Frame.__init__(self, master) self.grid() self.b1 = Button(self, text='GALETTE', bg = '#CCC', fg=None, bd=5, relief=SUNKEN) self.b1.grid(row=1, column=1, padx=5, pady=5) def demo(self): img = Image.open(Photo1) img2 = ImageTk.PhotoImage(img) self.b1['photo'] = img2 def mainloop(self): self.Demo() self.master.mainloop() if __name__ == '__main__': App().mainloop() A: Unfortunately there is no possible way to have a background color on a button. Buttons offer only a few limited color options, including: Normal text color Active background color Inactive background color The inactive background color is only used for widgets that display several states such as check buttons. Note that the current color of a button is inherited from the parent widget when the button is created and must be set explicitly. Your example code actually works on my machine since I am on Mac OSX and use Aqua theme. If you want to have it work on Windows, you'll have to set the foreground color manually. Q: Is it possible to get notification of newly created (or modified) files, as well as directory/sub-directory contents? I'm on a Mac, with the Finder app installed. Is it possible to get notifications when new files are created in a directory, as well as when new files in the directory are modified? A: What I normally use, if I have the need, is the Gnomevfs project. It's a GNOME system service that will monitor and notify you when files, folders, mounted volumes etc. are added, deleted or changed. A quick google will get you to the Gnomevfs FAQ for you to get started with it. Informatics in the diagnosis and management of spinal muscular atrophy. The use of informatics in the diagnosis and management of spinal muscular atrophy (SMA) is reviewed. Spinal muscular atrophy is the most common, recessively inherited, autosomal recessive motor neurone disease. Sequencing of the SMN1 gene and deletion of the SMN2 gene is the only test available that reliably identifies carriers of SMA. Introduction of SMN gene-targeted therapy as treatment has led to improved survival. Early treatment can reduce the rate of motor decline and increase the rate of motor improvement and is recommended for individuals with type 2 SMA. Currently, access to genotype testing and molecular information is complex and costly. Electronic patient records can be used to guide the delivery of patient information and improve patient outcomes. Newer end points are being developed to assess motor decline and the use of parent-reported outcomes for clinical trial assessment is discussed. It is not yet clear how this can be achieved with limited resources and whether it would have clinical significance.Endogenous salicylic acid up-regulates spermidine/spermine N1-acetyltransferase from Nicotiana tabacum, increasing its acetyltransferase activity. The enzyme spermidine/spermine N(1)-acetyltransferase (SSAT) is an important biological molecule, involved in determining plant immunity. Salicylic acid (SA) was detected in Nicotiana tabacum seedlings, and its levels increased during systemic acquired resistance (SAR) and acquired resistance (AR), compared with untreated plants. This study aimed to evaluate the effects of SA and N(1)-acetylspermidine on the SSAT activity of N. tabacum. S
